AB Compds. H₂C:CR₁CONR₂R₃OH (R₁ = H, Me; R₂ = H, C₁-6 alkyl; R₃ = C₂-6 alkylene)
are reacted with vinyl ethers to afford title compds. (i.e., monomers). The
Markush compds. above may be N-hydroxyethyl(meth)acrylamide. Compns. of the
monomers and basic compds., for inks, coatings, adhesives, etc., are also
claimed. Thus, 115 g N-hydroxyethylacrylamide was reacted with 131 g
triethylene glycol divinyl ether in the presence of 4-hydroxy-2,2,6,6-
tetramethylpiperidine-N-oxyl and HCl at 30° to give a compound (NMR and IR
chart given).

AB The polymer systems of the present invention degrade in the presence of an ejaculate. They may further provide degradable sequences that degrade upon contact with an ejaculate and/or microbicides. The polymer systems of the present invention are of use in the oral, rectal or vaginal cavities of an individual for such purposes as the treatment or prevention of sexually transmitted disease, the prevention or promotion of fertility or for hormone replacement therapy. Poly(hydroxypropylmethacrylate-nitrophenylcarbonate) was crosslinked with PEG-NH2-PRO-Phe-Arg-Gly-OH to obtain a gel. The above gel was completely degraded in 3 days when incubated in 3 fresh aliquots of seminal fluid every 24 h.

AB A composition is coated onto a substrate and crosslinked so as to form a pressure-sensitive adhesive (PSA), by polymerizing free radically polymerizable monomers having pendent unsatn. in the polymer component, other unsatd. monomer, photoinitiator, optionally tackifier, plasticizer, inhibitor, and chain transfer agent. A PSA adhesive was prepared by polymerizing isooctyl acrylate, isobornyl acrylate, and acrylic acid to give a syrup, reacting with aziridinyl functional acrylate monomer, coating onto a PET film, and photocrosslinking.

AB The title esters CH₂:CHCH:C(CN)CO₂R2O₂CCR1:CH₂ (R1 = H, Me; R2 = alkyl, alkenyl, alkynyl, alkoxyalkyl, polyoxyalkyl, aryl, cycloalkyl, heterocyclic, with or without substituents including halogens) are synthesized by reaction of acrolein with the corresponding (meth)aryloyl(poly)oxyalkyl cyanoacetates. The resultant reactive monomers containing multiple unsatn. are capable of anionic, cationic and free-radical polymerization yielding from rubbery or thermoplastic to highly crosslinked products depending on the degree of cure. The reactive monomers can be used for structural adhesives both in industry and medicine, for coatings, and in photo or electron beam resist manufacture

AB Printing plates are prepared by forming a toner image on a peelable transfer layer containing a resin, capable of being removed by chemical reaction, on an electrophotog. light-sensitive element, providing an adhesive layer containing a thermoplastic resin only on the toner image, transferring the toner image together with the transfer layer and the adhesive layer from the element to a temporary receptor, transferring the toner image with the layers to a receiving material with a hydrophilic surface, and partially removing the transfer layer by chemical reaction. Printing plates which produce good prints can be obtained for a long period of time even when the thickness of the transfer layer is reduced or the transfer is conducted under low temperature, low pressure, and high speed.

AB Non-enolizable esters, especially liquid non-distillable esters of 2-cyanoacrylic acid, are purified (to remove contaminating volatile acids and acid precursors) by passage through a metallic reagent, optionally dispersed on a solid insol. (inert or reactive) support, that reacts with and removes the acids or precursors. The metallic reagent is chosen from a metal, a metal oxide, and a non-reducing metal hydride (e.g., Li, Na, K, Ca, Al, Fe, MgO, CaO, Al₂O₃, CaH₂, etc.). The cyanoacrylate ester is dissolved in an inert solvent and then passed through the column at from -20° to 150° (preferably 20-40°) to prevent thermal reactions. After passage through the metallic reagent-containing bed, the purified cyanoacrylate ester monomer is stabilized by addition of a polymerization inhibitor.

AB The title esters, including non-distillable esters, are prepared by reacting 2-cyanoacrylic acid (I) or an acid halide of I with an alc., diol, polyol, or phenol in the presence of an inert organic solvent under polymerization-inhibiting conditions (and also in the presence of an acid catalyst when I is a reactant), continually removing the water or H halide produced, and recovering the ester. The esters are useful in adhesive compns. and for linear and crosslinked polymers. A diester was prepared by reacting I with 1,8-octanediol in benzene containing p-toluenesulfonic acid and SO2.

AB The title compds. are prepared by esterification of saponified α -cyanoacrylate-1,3-diene Diels-Alder adducts with polyhydric alcs., then thermal decomposition of the resulting polyhydric alc. cyanoacrylate-diene adducts. Thus, Et cyanoacrylate was reacted with cyclopentadiene in xylene at room temperature for 1 h, saponified with KOH at 60° for 1 h, esterified with decanediol in the presence of p-MeC6H4SO3H and hydroquinone under reflux for 8 h, and refluxed in the presence of Me cyanoacrylate, hydroquinone, and p-MeC6H4SO3H at 138° for 1 h to give 58.4% decanediol bis(cyanoacrylate) (I). An adhesive composition containing I showed good adhesiveness and solvent resistance.

AB Polymerizable enamines were synthesized by the reaction of 2-acetoacetoxyethyl methacrylate (AAEMA) with various aliphatic mono- and diamines. The enamines were characterized by elemental analyses, IR, ¹H NMR and ¹³C NMR spectroscopy. Radical polymerization of synthesized enamines yielded polymers with pendant enamine groups which were also prepared by the reaction of poly(AAEMA) with the corresponding amines.

AB The nucleophilic ring-opening of dicyanoketene ethylene or propylene acetals by tertiary amine vinyl monomers readily leads to new crystalline zwitterionic monomers. Sixteen monomers were obtained with yields >70%, and their polymerization at 60° initiated by AIBN was straightforward. Mol. wts. of a methacrylate series were controlled from 5 + 106 to 1 + 105 using 2-mercaptoethanol as a transfer agent.

ED Entered STN: 01 Apr 1988

AB Highly reactive polymers bearing -CONHCOCO2R groups (R = hydrocarbyl) are useful in coatings, adhesives, and moldings. Adding 127 g oxalyl chloride over 30 min to 71 g acrylamide in 200 g CH2Cl2 at 0° gave a 50% solution of ClCH2CH2CONHCOCOC1, the reaction of 100 g of which with 13.8 g EtOH in CH2Cl2 at <25° gave 41.5 g ClCH2CH2CONHCOCO2Et, dehydrochlorination of which by Et3N in C6H6 at room temperature gave 86% CH2:CHCONHCOCO2Et (I), AIBN-initiated polymerization of I in dioxane-BuOAc at 100° gave a polymer (mol.weight 8940, polydispersity 5.25) which was coated on tinplate and baked 3 h at 100° to give a 20-μ film with pencil hardness HB.

AB Polymers from monomers bearing the groups -CONHCOCOR (R = hydrocarbon chain bearing ≥ 1 lower alkyl group) are useful in coatings, adhesives, and moldings. Adding 78.5 g EtOCOCOC1 over 2.5 h to a refluxing solution of 49.1 g methacrylamide in 288.5 mL C6H6 and refluxing 5 h gave 45.8 g CH2:CMcCONHCOCOC2Et (I). Adding I 8.8, Me methacrylate 8.8, styrene 12.4, 2-hydroxyethyl methacrylate 11.8, Bu acrylate 8.2, and AIBN 1.0 g over 2 h to 15 g EtOCH2CH2OAc and 25 g BuOAc at 100°; adding 0.5 g AIBN and 10 g EtOCH2CH2OAc over 30 min, and heating 3 h gave a 50% solution of pale yellow polymer with mol. weight 7700.

AB Polymerizable unsatd. esters or amides of [(HO)2P(O)]2CROH (I, R = hydrocarbon) were prepared by reaction of I (or its salt) with one or more polymerizable unsatd. compds. containing oxiranyl groups or at least one amino group. The esters and amides are used in the preparation of water-soluble adhesives or resinous compns. Thus, 34.3 parts 60% aqueous I (R = Me) and 56.8 parts glycidyl methacrylate were stirred at room temperature for 40-50 min to give a homog. transparent liquid [R1R2P(O)]2CROH II, [R = Me; R1 = R2 = CH2:CMcCO2CH2CH(OH)CH2O(Q)]. The liquid 10, (NH4)2S2O8 0.1, and ascorbic acid 0.2 part were heated to 50° under N 2 h giving a resin which had tensile strength 153 kg/cm2. Among 6 more II prepared were (R, R1R2 given): Ph, Q2; Me, [CH2:CHCH2OCH2CH(OH)CH2O]2; Me, [CH2:CMcCO2CH2CH(OH)CH2O] (NaO); Me, (CH2:CHCONH)2.

AB Acrylamidopolyol acrylates were mixed with 0-15% peroxide and 0-15% organic accelerator and used as adhesives for Al [7429-90-5], Ti, and their alloys. Thus, 2-acrylamido-2-ethyl-1,3-propanediol diacrylate [57950-40-0] was prepared by treating 2-amino-2-ethyl-1,3-propanediol [115-70-8] with 3 equivs. of acryloyl chloride [814-68-6] and was combined with 5% Me Et ketone peroxide and 5% Co naphthenate and used to adhere a strip of pure Al with a strip of a 6% Al-4% V-90% Ti alloy [1107-75-8], giving an adhesive bond which lost 0.0741% weight after 2 hr in boiling water and had lap shear strength 7.6 + 106 N/m².
